## Analysis of Covid-19 chest x-rays

**Relevant training course:** Data Scientist

**Level of difficulty:** 07/10

### Description of the project:

*In order to diagnose patients with Covid-19, the analysis of chest X-rays is a possibility to be explored to more easily detect positive cases. If the classification through deep learning of such data proves effective in detecting positive cases, then this method can be used in hospitals and clinics when traditional testing cannot be done.*

### Resources to refer to:

- **Data:**
  - The data set contains chest x-ray images for covid-19 positive cases but also x-ray images of normal and viral pneumonia. Link to dataset: <https://www.kaggle.com/tawsifurrahman/covid19-radiography-database>
  - (Data size: 1.15 Gb)
- **Bibliography:**
  - <https://arxiv.org/abs/2003.13865>
  - <https://doi.org/10.1016/j.combiomed.2021.105002>

### Validation conditions for the project:

- an exploration, data visualization and data pre-processing **report** ;
- a modeling **report** ;
- a final **report** and associated **GitHub**.
